                                                                    The invention relates to a process for preparing animal feed by agglomerating feed ingredients with a thermostable phytase, which is added before or during agglomeration. The thermostable phytase is useful for expression in transgenic plants. These plants are useful in the preparation of animal feed itself. The thermostable phytase allows animal phytase-expressing transgenic plants. These plants provide a feed phytase allows animal feed to be produced more efficiently, in addition to improved phytase-expressing transgenic plants. These plants provide a feed additive (phytase) simultaneously.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   tctgctatttctccagacgttccagactgtagagttactttcgttcaagttttgtct 240

Novel phytases with improved properties such as temperature stability, pH stability and substrate specificity, for use in pharmaceuticals and compound foods and feeds -Claim 10; Fig 7a-c; 240pp; English. P-PSDB; AAB20526 

The present invention describes improved phytases, preferably with increased thermostability, and methods for producing them. The methods of an be used for producing phytases with improved properties e.g. temperature stability, plm stability, plm profile, temperature profile, specific activity, substrate specificity, substrate cleavage pattern, substrate binding, position specificity, the velocity and level of release of phosphate. Trom corn, reaction rate, phytate degradation rate, pharmaceutical compositions or compound food or feeds. The feed can be used to reduce levels of phytate in animal manure, by converting it min lower inositol phosphates and/or inositol and inorganic phosphate. present sequence encodes a phytase sequence from the present invention.

translation, comparising phytase (myo-inosito) hexakisphosphate formulation, comparising phytase (myo-inosito) hexakisphosphate formulation, comparising phytase (myo-inosito) hexakisphosphate formulation for more stabilising agents including composition for indicate a first a molecular weight of 600 to 4000 Da, preferably 1000 to 3350 Da; the disodium salts of malonic, composition for monogastric animals (e.g., pigs, poultry) and provides a monogastric animals (e.g., pigs, poultry) and prosphorus. Although a large amount of phosphate is present in animal feed in the form of phytate phosphorus, monogastric animals are unable to utilise this form of phosphorus, monogastric animals are unable to utilise this form of phosphate, resulting in the addition of extra phosphate to the feed of such animals. Phytase enhances the nutritional continue of plant material without the need for adding additional phosphate continued by adding phytase to animal feed, as the animal can make use of the inorganic phosphate liberated from phytate phosphorus using the enzyme. The phytase formulation of the invention has an improved and enzyme formulation of the invention has an improved and can withertand feed processing methods such as a microal a material and pelleting rithe present sequence represents DNA encoding a matent of phytase-1 consensus sequence, phytase-1-thermo[8]-0507-K91A, which has a temporal of phytase-1 thermolesius point 7 degrees Celsius higher than that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a novel stabilised dry or liquid enzyme
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New stabilized enzyme formulation, useful for feed compositions
                                                                                                                                                                                                                                                                           /product= "Phytase-1-thermo[8]-Q50T-K91A"

Lehmann M;

WPI; 2000-491161/43: P-PSDB; AAB20532. Novel phytases with improved properties such as temperature stability, pH stability and substrate specificity, for use in pharmaceuticals and compound foods and feeds

Disclosure; Fig 23a-c; 240pp; English.

The present invention describes improved phytases, preferably with increased thermostability, and methods for producing them. The methods can be used for producing phytases with improved properties e.g. temperature stability, pH stability, pH profile, temperature profile, substrate specificity, substrate cleavage pattern, substrate binding, position specificity, substrate cleavage pattern, release of phosphate from corn, reaction rate, phytate degradation rate, pharmaceutical compositions or compound food or feeds. The feed can be used to reduce levels of phytate in animal manure, by converting it into lower inositol phosphates and/or inositol and inorganic phosphate. The present sequence encodes a phytase sequence from the present

increased thermostability, and methods for producing them. The methods can be used for producing phytases with improved properties e.g. temperature stability, pH stability, pH profile, temperature profile, specific activity, substrate specificity, substrate cleavage pattern, substrate binding, position specificity, the velocity and level of release of phosphate from corn, reaction rate, phytate degradation rate, pharmaceutical compositions or compound food or feeds. The feed can be used to reduce levels of phytate in animal manure, by converting it into lower inositol phosphates and/or inositol and inoganic phosphate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            getagattggaagetgaettgecaggtgttaetttgaetgaegaagaegttgtttaettg 780

This sequence encodes the consensus Ascomycete phytase sequence.
The invention relates to variant phytase enzymes with specific amino acid substitutions for improved properties. The phytase variants can be used for liberating phosphorus from a phytase substrate. They can be used for reducing phytate levels in animal manure. They can be used in feed or food preparations. The phytase DNA can also be used to produce transgenic plants which can be used in feeds or foods. The phytase variants can also be used in soy processing and in the manufacture of inositol or stability, temperature stability, pH profile, temperature profile, specific activity (in particularly in relation to pH and temperature), substrate specificity, substrate cleavage pattern, substrate binding, con position specificity, the velocity and level of release of phosphate con manufacture and end level of

```
This invention describes a novel process for the preparation of a consensus protein. The specific example given in the specification is that of a fungal phytase (myo-inosttol hexakisphosphate) which hydrolyses phytase to valuable feed additives, with a fully defined amino acid sequence given in the specification, or variant or mutein. The method is useful for improving protein properties by altering their sequence. The consensus protein and mutein are useful in food, feed or pharmaceutical
                                                                                                                                                                                                                                                                                                                                                                                                                             compositions. This sequence encodes the consensus phytase protein used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  attaagttotacagaagatacaaggotttggotagaaagattgttocattcattagagot 480

The present invention describes improved phytases, preferably with increased thermostability, and methods for producing them. The methods can be used for producing phytases with improved properties e.g. temperature stability, pH stability, pH profile, temperature profile, specific activity, substrate specificity, the velocity and level of release of phosphate from corn, reaction rate, phytate degradation rate, pharmaceutical compositions or compound food or feeds. The feed can be used to reduce levels of phytate in animal manure, by converting it into lower inosition for phytate in animal manure, by converting it.
                                          Phytase; mutant; thermostability; mutation; mutagenesis; pH stability; temperature stability; pH profile; temperature profile; reaction rate; specific activity; substrate specificity; substrate cleavage pattern; substrate binding; position specificity; phytate degradation rate;
                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel phytases with improved properties such as temperature stability, pH stability and substrate specificity, for use in pharmaceuticals and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel stabilised dry or liquid enzyme formulation, comprising phytase (myo-inositol hexakisphosphate phosphotylorlase) and one or more stabilising agents including xylitol or ribitol; polyethylene glycols with a molecular weight of 600 to 4000 Da, preferably 1000 to 3350 Da; the disodium salts of malonic, glutaric and succinic acid; carboxymethylcellulose; and sodium alginate. The stabilised phytase formulation is used in a method for preparing a feed composition for monogastric animals (e.g., pigs, poultry) and
                                                                                                                                                                                                    Phytase; myo-inositol hexakisphosphate phosphohydrolase; stabilisation;
thermostable; animal feed; monogastric animal; phytate phosphorus;
phosphate availibility; consensus; phytase-1; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New stabilized enzyme formulation, useful for feed compositions for

provides a monogastric animal with its dietary requirements of phosphorus. Although a large amount of phosphate is present in animal feed in the form of phytate phosphorus, monogastric animals are unable to utilise this form of phytate phosphorus, monogastric animals are unable to utilise this form of phosphate, resulting in the addition of extra phosphate to the feed of such animals. Phytase enhances the nutritional control of plant material without the need for adding additional phosphate to the feed. The lovel of phosphate pollution in the environment is reduced by adding phytase to animal feed, as the animal can make use of reduced by adding phytase liberated from phytate phosphorus using the enzyme. The phytase formulation of the invention has an improved the invention has an improved and can therefore remain stable during long-term storage and can withstand feed processing methods such as extrusion, expansion and pelleting. The present sequence represents sequence represents a consensus sequence, designated phytase-1, which was derived from the mature additionally contains the Aspergillus terreus cbs116.46 signal peptide at 

Sequence 1426 BP; 338 A; 311 C; 308 G; 469 T; 0 other;

The invention relates to a process for preparing animal feed by agglomerating feed ingredients with a thermostable phytase, which is added before or during agglomeration. The thermostable phytase is useful for expression in transgenic plants. These plants are useful in the preparation of animal feed itself. The thermostable phytase allows animal feed to be produced more efficiently, in addition to improved phytase-expressing transgenic plants. These plants provide a feed

WPI; 2000-491161/43. P-PSDB; AAB20527 Novel phytases with improved properties such as temperature stability, pH stability and substrate specificity, for use in pharmaceuticals and compound foods and feeds -

Claim 10; Fig 8a-c; 240pp; English.

The present invention describes improved phytases, preferably with increased thermostability, and methods for producing them. The methods can be used for producing phytases with improved properties e.g. temperature stability, pH stability, pH profile, temperature profile, specific activity, substrate specificity, substrate cleavage pattern, substrate binding, position specificity, the velocity and level of release of phosphate from corn, reaction rate, phytate degradation rate, pharmaceutical compositions or compound food or feeds. The feed can be used to reduce levels of phytate in animal manner, by converting it into lower inositol phosphates and/or inosicol and inorganic phosphate.

stabilized enzyme formulation, useful for feed compositions for Ξ., (HOFF ) HOFFMANN LA ROCHE & CO AG Example 5; Fig 19; 101pp; English Brugger R, Lehmann M, Wyss M; 98EP-0111960

The invention relates to a novel stabilised dry or liquid enzyme formulation, comprising phytase (myo-inositol hexakisphosphate phosphohydrolase) and one or more stabilising agents including to phosphohydrolase) and one or more stabilising agents including to the phosphohydrolase) and one or more stabilising agents including to to 4000 ba, preferably loud to 3350 ba; the disodium salts of malonic, to 4000 ba, preferably loud to 3350 ba; the disodium salts of malonic, and succinic acid; carboxymethylcellulose; and sodium alginate. The stabilised phytase formulation is used in a method for preparing a feed composition for monogastric animals (e.g., pigs, poultry) and provides a monogastric animal with its dietary requirements of phosphorus. Although a large amount of phosphate is present in animal feed in the form of physphorus, monogastric animals are unable to utilise this form of phosphate, resulting in the addition of extra phosphate to the feed of such animals. Phytase enhances the nutritional value of plant material without the need for additing additional phosphate consents adding phytase formulation of the invention has an improved the inorganic phosphate liberated from phytate phosphorus using the caryme. The phytase formulation of the invention has an improved and can therefore remain stable during long-term storage and can withstand feed processing methods such as extrusion, expansion and pelleting. The present sequence represents DNA encoding a mutant phytase-10 consensus sequence, phytase-10-thermo(3)-050T-K91A, which has

```
a temperature optimum and melting point 4 degrees Celsius higher than that of phytase-10 (AAX69566). Its specific activity with phytate as a substrate is also strongly increased.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          840
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  841 ttctgtgctttgttcactcacgacgaatggatccaatacgactacttgcaaagcttgggt 900

rel phytases with improved properties such as temperature stability, stability and substrate specificity, for use in pharmaceuticals and moound foods and feeds compound foods and feeds Novel

```
ö
                          The present invention describes improved phytases, preferably with increased thermostability, and methods for producing them. The methods can be used for producing phytases with improved properties e.g. temperature stability, pH stability, pH profile, temperature profile specific activity, substrate specificity, substrate cleavage pattern, substrate binding, position specificity, the velocity and level of release of phosphate from corn, reaction rate, phytate degradation rate, and end level of released phosphate. The phytases can be used to produce pharmaceutical compositions or compound food or feeds. The feed can be used to reduce levels of phytate in animal manure, by converting it into lower inositol phosphates and/or inositol and inorganic phosphate.
                                                                                                                                                                                                                                                                                                                                                                                                                       61 gccttgggtcctcgtggtaattctcactcttgtgacactgttgacggtggttaccaatgt 120

The present invention describes improved phytases, preferably with increased thermostability, and methods for producing them. The methods can be used for producing phytases with improved properties e.g. temperature stability, ph stability, ph profile, temperature profile, specific activity, substrate specificity, substrate profile, substrate binding, position specificity, the velocity and level of release of phosphate from corn, reaction rate, phytate degradation rate, and end level of released phosphate. The phytases can be used to produce pharmaceutical compositions or compound food or feeds. The feed can be used to reduce levels of phytate in animal manure, by converting it into lower inositol phosphates and/or inositol and inorganic phosphate. The present sequence encodes a phytase sequence from the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     240

The present invention describes improved phytases, preferably with increased thermostability, and methods for producing them. The methods and be used for producing phytases with improved properties e.g. temperature stability, ph stability, ph profile, temperature profile, specific activity, substrate specificity, the profile, temperature profile, substrate binding, position specificity, the velocity and level of relasse of phosphate from corn, reaction rate, phytate degradation rate, pharmaceutical compositions or compound food or feeds the feed can be used to reduce levels of phytate in animal manure, by converting it into lower inositol phosphates and/or inositol and inorganic phosphate. The present sequence encodes a phytase sequence from the present

Sequence 1426 BP; 340 A; 308 C; 310 G; 468 T; 0 other;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
